Links

//target attribute
- **<a** href="http://matthewhess.co" target="_blank"**>** Matt's page **** //target is an attribute and its value is set to _blank in order to open the Matt's page in a new window
- **<a** href="index.html"**>** Home **** //if all pages are in the same folder then the value of the href attribute is just the filename in the root folder.

Directory Structure:

Root:
- Contain a file called index.html
- Contain other individual folders for different sections of the website

Sub-Directories:
- Each also have to include a index.html // homepage of that section

If the site is organized in separate folders, you need to be specific when linking pages using the following:

Same Folder	**<a** href="reviews.html">Reviews****
Child Folder	**<a** href="music/listings.html">Listings****
GrandChild Folder	**<a** href="movies/dvd/reviews.html"> Reviews****
Parent Folder	**<a** href="../index.html">Home**** // ../ goes up one folder
GrandParent Folder	**<a** href="../../index.html">Home**** // ../../ goes up two folders etc.

//A forward slash will return the homepage for the entire site, and a forward slash followed by a file name will return that file providing it is in the root directory.

- **<a** href="mailto:matthewh@example.org"**>** Matt's Email **** //mail button called Matt's email

//id attribute
<h1 id="top"**>** Interesting Facts About Me **</h1>** // id attribute: the value of the attribute should start with a letter or an underscore. Not a number or any other character.
<a href="#top"**>** link to top ****
- **<a** href="http://htmlandcssbook.com/#bottom"**>** bottom of the webpage ****
